

Variable

This action allows you to define a variable with an initial value. Although it is possible to declare variable using the [code](#) system, this action allows to do so using a more visual method.

Standard options

Input parameters

Variable

The variable name.

Value

The variables initial value. This is optional.

Type

The variable type. Three standard types are available:

- String: text variable
- Integer: integer variable (non-decimal)
- Decimal: decimal variable (real)

Exceptions

- [Bad parameter](#)
- [Code error](#)
- [Timeout](#)
- [Conversion failed](#)

Conversion failed

This exception is thrown when the conversion failed.

- Default action: stop the script execution
